

Multi-Factor Authentication

Biometrics

As customer consideration and government regulation guide financial transactions into the future, many financial institutions are looking to mitigate their digital security risk by requiring an additional “key” for network access.

Juniper Payments has teamed with CrossMatch, the leader in fingerprint based biometric security, to provide clients with biometric technology, the best choice in multi-factor network authentication available today.

A network’s weakest link is often a human one, and it begins with each user’s password. Security is only as strong as your most careless user, and passwords are often shared, guessed or written down. Hackers can infiltrate a password by placing a ‘Trojan’ on the machine of an unsuspecting employee who occasionally browses the Internet. Therefore, failure to properly authenticate each user can compromise the security of your most delicate files and financial transactions.

Biometric security, however, utilizes credentials that are carried with the user at all times. Physical characteristics like fingerprints cannot be forgotten, borrowed, nor copied, and can never be stolen.

One-Time Passcodes

In addition to Biometrics, Juniper Payments offers One-Time Passcode (OTP) options for out-of-network authentication.

OTPs, generated by Juniper Payments, are unique single session credentials that are automatically sent to either an end user’s email address or mobile device via Text message, for layered security. Passcodes are sent immediately to ensure a simplified login process.

- Options to best fit your security needs
- Reduce support costs
- Increase Security
- End user specific control
- Integrated with all Juniper Payments modules
